Formula Used: The frequency of A.C mains is determined by formula for fundamental frequency of stretched string which is given by: $n = \frac{1}{2l} \sqrt{\frac{T}{m}}$ Where l = length of the sonometer wire between the two bridges when it is thrown into resonant vibrations. T = tension applied to the wire = Mg , m = mass per unit length of the wire = ρ .

With direct current, it's easy to determine the voltage that's present between two points in an electronic circuit: You simply measure the voltage with a voltmeter. With alternating current, however, measuring the voltage isn't so simple. That's because the voltage in an alternating current circuit is constantly changing. There are actually three ways you can [...]
